More than a decade in cybersecurity, where dense data and high stakes taught me to make complex products clear and trustworthy. I bring that clarity to any domain and own features end to end, from framing the problem to shipping in production, using AI to move faster.

EXPERIENCE

Shift | Founding Designer

10/2024-Present · AI-native third-party risk platform

Joined as the first designer and defined the human-agent operating model: where agents act on their own and where people decide. The resulting workflow cut manual hours and raised vendor onboarding completion rates.

Built the design system, onboarding, and core workflows connecting vendor evidence, access, exposure, and risk decisions, through to public launch.

Onyxia | Product Design Team Lead

04/2024-10/2024 · Data platform for the CISO office

Took over and led product design for a CISO data platform that brought security tools, BI, Jira, and ServiceNow into one working view.

Redesigned the core journeys to industry standards, turning benchmarks and SLAs into tasks with owners, deadlines, and progress.

Veriti | Founding Designer

11/2021-04/2024 · Multi-vendor remediation platform

Created the design system and core interaction model over two and a half years as founding designer.

Defined the flow from a known exposure to an approved fix: trace the configuration gap, explain the proposed control change, and require approval before it reaches production.

Designed a composable filter grammar for high-volume security insights that fit the existing product without a redesign.

Semperis | UX Team Lead

08/2020-11/2021 · Identity security

Built and led the in-house UX team as the company expanded from Active Directory recovery into continuous identity security.

Defined a shared product language for vulnerabilities, risky configurations, alerts, and insights, ranked by severity and urgency.

Check Point Software | UX Expert

03/2014-08/2020 · Enterprise security management

Planned and led WatchTower from concept to its 2019 iOS and Android launch: defined the audience with a major partner, set scope, ran usability testing, and adapted an enterprise release process to ship a consumer-style app.

Reorganized security management spread across 20+ tabs into one system built around administrators' daily work, inside an R&D organization of hundreds of developers.

CERTIFICATES

Meta Front-End Developer Certificate

Coursera · 2023

Programming the .NET Framework

John Bryce · 2010-2011

EDUCATION

B.A. Economics

Tel Aviv University · 1994-1996

Diploma, Digital Communications & Media

Camera Obscura School of Arts · 1996-2000

SKILLS

Product design
Design systems
Problem framing
Scope definition
Complex data & workflows
Stakeholder alignment
AI-native workflows
Prototyping to production

TOOLS

Figma, Cursor, Claude Code, Codex
